ABSTRACT

1.1 Problem Background

In the modern software development ecosystem, developers rely on multiple disconnected platforms to present their work, such as GitHub for repositories, blogging platforms for technical content, and hosting services for deployed applications. This fragmentation creates challenges in maintaining a unified professional identity and makes it difficult for recruiters and collaborators to evaluate a developer's complete profile efficiently. Additionally, there is no integrated platform that combines authentication, project showcasing, technical blogging, and live deployment previews. This lack of consolidation reduces visibility, increases complexity, and limits the effective presentation of technical skills.

1.2 Objective of the Project

The objective of Devsphere is to develop a unified web-based platform that allows developers to authenticate using GitHub, automatically fetch profile data, create blogs, showcase projects, and integrate live deployment previews within a single, structured environment.

1.3 Proposed Solution / System Overview

Depsphere is a centralized developer platform designed to integrate user identity, technical content, and live project demonstrations. The system enables users to securely sign in using GitHub OAuth, ensuring verified identity and seamless onboarding. Upon authentication, user data such as profile details and repositories can be fetched and displayed. Developers can create and manage blog posts to describe their projects and experiences. Additionally, the platform supports integration with Vercel to embed live previews of deployed applications directly within the interface. The major components of the system include an authentication module, profile management module, blog management system, project showcase module, and deployment integration module, which work together to support structured content management and ownership clarity.

1.4 Key Features or Functionality

Key features include GitHub-based authentication, automated profile data extraction, customizable developer profiles, blog creation and management, project showcasing with repository integration, and live deployment previews using Vercel. The system provides a user-friendly interface, centralized content management, and seamless integration between code repositories and deployed applications.

1.5 Technology / Method Used

The platform is developed using Next.js and React for full-stack implementation. GitHub OAuth is used for authentication, while PostgreSQL or MongoDB is used for database management. Vercel APIs are integrated to fetch and display live deployment previews efficiently.

1.6 Expected Outcome & Benefits

The expected outcome is a scalable and efficient platform that simplifies developer portfolio management and enhances professional visibility. Devsphere reduces fragmentation by consolidating multiple functionalities into one system, improving accessibility for recruiters and collaborators. It enables structured presentation of technical work, encourages knowledge sharing, and supports better evaluation of developer capabilities.

1.7 Original Contribution Statement

Depsphere uniquely combines GitHub authentication, automated data extraction, blogging, project showcasing, and live deployment previews into a single unified developer ecosystem.
